

Variation 1: Cardiac (Congestive Heart Failure)

Subject: Discharge Dictation – Patient: Anjali Deshpande

"Okay, let's do the summary for Anjali Deshpande, uh, UHID two zero two six zero zero nine eight one zero. Female, sixty-eight years old, admitted on the twelfth of February, around... let's say four-thirty in the afternoon under Cardiology.

Patient came in with worsening pedal edema—swelling in the legs—for about a week, and she's been having difficulty breathing when lying down at night. Known case of congestive heart failure for five years and also has hypertension. On admission, she was a bit tachycardic, pulse was one-ten, BP was quite high at one-sixty over ninety-five, and her SpO2 was eighty-nine percent on room air.

On examination, we heard bilateral crackles and noted significant pitting edema in both legs. We did the routine labs... NT-proBNP was significantly elevated. Chest X-ray showed pulmonary congestion and a bit of an enlarged heart—cardiomegaly. Diagnosis was Acute Decompensated Heart Failure.

Management started with IV Lasix to get the fluid off, and we had her on three liters of oxygen via nasal cannula initially. We monitored her weight and electrolytes daily. She responded really well to the diuresis. Leg swelling has almost gone and she's breathing much better now. No invasive procedures, just medical management.

Today she's stable, BP is down to one-twenty-eight over eighty-two, SpO2 is ninety-six percent on room air. Ready for discharge. Final diagnosis: CHF with Hypertension. Discharge meds: Tablet Furosemide forty milligrams once daily, and Tablet Telmisartan forty milligrams once daily.

Advise the patient to strictly limit salt intake and monitor her daily weight. If she gains more than two kilos in a few days, she needs to call us. Activity as tolerated, but no heavy lifting. Follow up in the Cardiology OPD on the twenty-sixth of February. Any sudden breathlessness or chest pain, she should report to ER immediately. Summary by ward intern."

Variation 2: Gastrointestinal (Acute Gastritis/Dehydration)

Subject: Discharge Note – Patient: Vikram Singh

"Right, discharge summary for Vikram Singh... UHID is two zero two six zero zero seven seven four three. Thirty-four year old male, admitted on the fifth of February, early morning around six AM under Gastroenterology.

He was admitted with severe epigastric pain, multiple episodes of vomiting, and a general feeling of weakness for two days. No known prior comorbidities, just a history of frequent outside food. On admission, he was a bit dehydrated. Pulse was ninety-eight, BP was one-ten over seventy, and he was afebrile—temperature was ninety-eight point six. SpO2 was fine at ninety-nine percent.

Abdominal exam showed some tenderness in the epigastric region, but no guarding. Blood work was mostly normal, though hematocrit was slightly high due to dehydration. Ultrasound of the abdomen was clear, no stones. Diagnosis: Acute Gastritis with mild dehydration.

We started him on IV fluids—normal saline—and IV Pantoprazole, along with some anti-emetics. Kept him NPO for the first twelve hours, then started clear liquids. He tolerated the diet transition well. No more vomiting since yesterday.

At present, he's feeling much better, pain has subsided, vitals are totally stable. He's fit for discharge today. Final diagnosis is Acute Gastritis. Medications for home: Tablet Pantoprazole forty milligrams once daily before breakfast for two weeks, and Syrup Antacid ten ml thrice daily if needed.

Advise him to stick to a bland diet for a week—no spicy or oily food. Plenty of oral fluids. Avoid caffeine and alcohol for now. Follow up in the GI OPD on the twelfth of February. If there's blood in the vomit or black stools, he should come back immediately. Prepared by duty nurse."

Variation 3: Respiratory (Acute Bronchitis/COPD Exacerbation)

Subject: Discharge Dictation – Patient: Mohammed Arif

"Okay, next one is Mohammed Arif, UHID two zero two six zero zero three two one eight. Seventy-two year old male, admitted on January thirtieth, around seven PM under Pulmonology.

Came in with a nasty cough, lots of green sputum, and he was really struggling to catch his breath. He's a long-term smoker and a known case of COPD for nearly fifteen years. On admission, he was using his accessory muscles to breathe. Temperature was ninety-nine point eight, pulse one-zero-five, BP one-forty-five over ninety, and SpO2 was eighty-six percent on room air.

On auscultation, we heard widespread wheezing and some rhonchi. We did a CBC—showed a high white cell count—and the Chest X-ray showed hyperinflated lungs but no clear consolidation. Diagnosis: Acute Exacerbation of COPD.

We started him on nebulized Budesonide and Levosalbutamol every four hours, plus IV antibiotics and a short course of oral steroids. He needed oxygen via venturi mask at thirty-five percent initially to keep his sats up. Over the week, the wheezing cleared up and we moved him back to his home inhalers.

Today he's back to his baseline. SpO2 is ninety-two percent on room air, which is normal for him. Vitals are stable. Fit for discharge. Final diagnosis: COPD exacerbation. Discharge meds: Continue his usual Tiotropium inhaler, and add Tablet Prednisolone twenty milligrams for five more days, tapering off after that.

Tell the patient he must stop smoking—it's crucial. Use the inhalers correctly. Stay away from dust and smoke. Follow up in the Pulmonology OPD on February seventh. If his breathlessness gets worse or sputum color changes, he needs to report back. Summary by the senior resident."

Variation 4: Orthopedics (Post-Op Fracture)

Subject: Discharge Dictation – Patient: Sarah Gonsalves

"Okay, let's get the notes down for Sarah Gonsalves... UHID is two zero two six zero zero six six one four. She's a twenty-eight year old female, admitted on the tenth of February after a fall. Admitted under Ortho.

She came in via the ER with severe pain and deformity in the left forearm. No other injuries, thank god. X-ray showed a displaced fracture of the radius and ulna. No prior medical history, she's otherwise healthy. On admission, her vitals were okay, BP one-twelve over seventy-four, pulse was ninety due to the pain, SpO2 ninety-nine percent.

We took her for surgery on the eleventh—ORIF, open reduction and internal fixation with plates and screws. Procedure went smooth. Post-op, we managed her pain with IV analgesics and kept the limb elevated. She's been started on physiotherapy for her fingers and elbow.

Today, the surgical site is clean, no discharge, and the neurovascular status of the hand is perfectly fine. She's stable and ready to go home. Final diagnosis: Closed fracture of both bones, left forearm. Medications: Tablet Etoricoxib ninety milligrams once daily for five days for pain, and some Calcium supplements.

Advice for the patient: Keep the slab dry, don't lift anything with that arm, and keep moving the fingers. Follow up in the Ortho OPD on the twenty-fourth of February for a wound check. If she notices any numbness or the fingers turning blue, she needs to come back to the ER right away. Dictated by the junior resident."

## Variation 5: Pediatrics (Acute Febrile Illness)

**Subject:** Discharge Summary – Patient: Master Aryan Mehta

"Right, doing the summary for Master Aryan Mehta... UHID two zero two six zero zero four four two zero. He's a five year old male, admitted on February fourteenth, around ten PM under Pediatrics.

The mother brought him in with very high fever for three days, refusing to eat, and a few episodes of loose stools. No prior history of asthma or allergies. On admission, the kid was quite lethargic and looked dehydrated. Temp was one-zero-three point one, pulse was one-thirty—bit high for his age—and BP was ninety over sixty.

Systemic exam was mostly unremarkable except for a slightly coated tongue and some abdominal tenderness. CBC showed a lowish platelet count, so we screened for Dengue and Malaria. Everything came back negative. Looks like it was just a viral prodrome with dehydration.

We gave him IV fluids for twenty-four hours and paracetamol for the fever. He started taking oral feeds much better by yesterday. Fever has been down for the last twenty-four hours now.

He's active today, playing in the ward, and vitals are stable. Fit for discharge. Final diagnosis: Acute Febrile Illness with mild dehydration. Meds: Syrup Paracetamol five ml as needed for fever, and plenty of ORS.

Advise the parents to keep him hydrated and watch for any rashes. Follow up with the Pediatrician on the twenty-first. If he becomes lethargic again or stops passing urine, bring him back immediately. Summary by ward nurse."

Variation 6: Neurology (Post-Seizure)

Subject: Discharge Dictation – Patient: Rajesh Iyer

"Okay, next is Rajesh Iyer, UHID two zero two six zero zero-one-one-five-nine. He's forty-four years old, male, admitted on February eighth under Neurology.

Patient was brought in after a witnessed generalized tonic-clonic seizure at his workplace. Lasted about three minutes. He was in a post-ictal state—confused and drowsy—when he arrived. No known history of epilepsy, but he's been under a lot of stress lately. Vitals on admission: BP one-forty over ninety, pulse eighty-eight, afebrile.

We did a CT Brain and an EEG. CT was normal, no bleeds or masses. The EEG showed some focal slowing in the temporal region. Bloods were all within normal limits, no electrolyte imbalances. Diagnosis: New-onset Seizure, likely provoked by sleep deprivation.

He was started on Levetiracetam five hundred mg twice daily. No further seizure activity noted during the three-day observation. He's back to his baseline mental state now.

Vitals are stable today, and he's fit for discharge. Final diagnosis: First-onset Generalized Tonic-Clonic Seizure. Meds: Tablet Levetiracetam five hundred mg twice daily.

Very important: Advise him not to drive or operate heavy machinery for at least six months. He needs to maintain a strict sleep schedule and avoid alcohol. Follow up in the Neuro OPD on the twenty-fifth. If he has another episode, he needs to be brought to the emergency immediately. Dictated by the Neuro-associate."

Variation 7: Urology (Kidney Stones)

Subject: Discharge Note – Patient: Suman Lata

"Okay, discharge for Suman Lata, UHID two zero two six zero zero-eight-eight-two-one. Fifty-year old female, admitted on February sixteenth, under Urology.

She came in with agonizing right-sided loin pain radiating to the groin. Associated with nausea and one episode of hematuria—blood in the urine. Known hypertensive for six years. On admission, she was in significant distress. BP one-fifty-five over ninety-five, pulse ninety-four.

Ultrasound showed a six-mm stone in the right distal ureter causing some hydronephrosis. Lab work showed normal creatinine, but a few RBCs in the urine. Diagnosis: Right Ureteric Calculus.

We managed her conservatively with heavy hydration, IV analgesics, and Tamsulosin to help the stone pass. She actually passed the stone yesterday morning—verified by the nurse. Pain has completely subsided now.

Vitals are stable, patient is comfortable. Fit for discharge. Final diagnosis: Ureteric Calculus (Passed). Meds: Tablet Tamsulosin zero point four mg at night for three more days, and plenty of water—at least three liters a day.

Advice: Avoid high-oxalate foods like spinach and chocolate for a bit. Follow up with a repeat ultrasound in two weeks. If the pain comes back or there's a fever, report back. Summary by duty doctor."

Variation 8: Dermatology (Severe Drug Rash)

Subject: Discharge Summary – Patient: Kevin D'Souza

"Alright, Kevin D'Souza, UHID two zero two six zero zero-two-three-nine-nine. Male, thirty-nine years old, admitted on February eleventh under Dermatology.

Presented with an itchy, red, maculopapular rash all over the torso and limbs. It started two days after he began taking a new antibiotic for a dental infection. No history of allergies before this. On admission, he was afebrile, pulse eighty-four, BP one-twenty over eighty.

Skin biopsy wasn't needed as the clinical picture was clearly a drug-induced exanthema. No mucosal involvement, which is good—ruled out Stevens-Johnson.

We stopped the suspected offending drug immediately and started him on oral antihistamines and a short course of topical steroids. The redness has faded significantly, and the itching is mostly gone.

Patient is stable and the rash is resolving. Ready for discharge today. Final diagnosis: Drug-Induced Exanthema. Meds: Tablet Cetirizine ten mg once daily for five days and Calamine lotion for local application.

Advice: He must remember the name of that antibiotic—Amoxicillin—and never take it again. I've given him a drug allergy card. Follow up in the Skin OPD on the twentieth. If he gets any swelling of the lips or trouble breathing, it's an emergency. Prepared by ward nurse."

## Variation 9: Cardiology (Acute Coronary Syndrome)

**Subject:** Discharge Dictation – Patient: Mahesh Sharma

"Okay, discharge summary for Mahesh Sharma, UHID two zero two six zero zero two two seven one. Fifty-eight year old male patient, admitted on March third around nine fifteen in the morning under Cardiology.

Patient came with complaints of severe chest pain radiating to the left arm for about one hour before arrival. Pain was associated with sweating and mild breathlessness. Known hypertensive for around ten years, on medication.

On admission, vitals were: BP one sixty over one hundred, pulse ninety-eight per minute, SpO2 ninety-five percent on room air. ECG showed ST depression in anterior leads.

We immediately did cardiac enzymes. Troponin-I came positive. Echocardiography showed mild hypokinesia of the anterior wall.

Diagnosis was Non-ST Elevation Myocardial Infarction.

Patient was started on dual antiplatelet therapy, statins, and heparin infusion. Condition gradually stabilized over the next two days. No further chest pain episodes.

Today vitals are stable and patient is comfortable. Discharge medications include Aspirin seventy-five mg once daily, Clopidogrel seventy-five mg once daily, Atorvastatin forty mg at night.

Advise strict blood pressure control, low-salt cardiac diet, and regular exercise after two weeks. Follow up in Cardiology OPD after ten days. If chest pain or breathlessness occurs again, report immediately."

Variation 10: Orthopedics (Fracture Management)

Subject: Discharge Dictation – Patient: Arun Nair

"Next case is Arun Nair, UHID two zero two six zero zero three four zero two. Thirty-two year old male, admitted under Orthopedics on March tenth around six in the evening.

Patient had a road traffic accident while riding a motorcycle. He presented with severe pain and swelling in the right leg. X-ray confirmed a closed fracture of the right tibial shaft.

Vitals were stable on admission, BP one twenty-eight over eighty-two, pulse eighty-four per minute.

Patient underwent closed reduction and intramedullary nailing on March eleventh. Surgery was uneventful.

Post-operative period was stable. Pain managed with analgesics and antibiotics were given prophylactically.

Now the surgical wound is healthy and patient is mobilizing with support.

Final diagnosis: Closed fracture right tibia status post intramedullary nailing.

Discharge medications include tablet Paracetamol six hundred fifty mg as needed for pain and tablet Cefuroxime five hundred mg twice daily for five days.

Advise non-weight bearing for four weeks and physiotherapy exercises. Follow up in Orthopedic OPD after two weeks for wound check and suture removal."

Variation 11: Gastroenterology (Acute Gastritis)

Subject: Discharge Dictation – Patient: Neha Kapoor

"Okay, discharge note for Neha Kapoor, UHID two zero two six zero zero four nine eight eight. Twenty-nine year old female patient admitted under Gastroenterology on March fifteenth.

Patient presented with complaints of upper abdominal pain and repeated vomiting for two days. No history of fever. She reported frequent consumption of spicy food and irregular meal timings.

On admission vitals were stable: BP one ten over seventy, pulse seventy-eight per minute.

Blood investigations were normal. Ultrasound abdomen showed no structural abnormality.

Diagnosis was Acute Gastritis.

Patient was treated with IV fluids, proton pump inhibitors, and antiemetics.

Symptoms improved significantly over forty-eight hours. Patient is now tolerating oral diet.

Discharge medications include tablet Pantoprazole forty mg once daily before breakfast and tablet Ondansetron four mg if vomiting occurs.

Advise soft bland diet for one week and avoid spicy or oily food. Follow up in Gastro OPD after seven days if symptoms persist."

## Variation 12: Pulmonology (Bronchial Asthma Exacerbation)

"Okay, discharge dictation for patient Farhan Ali, UHID two zero two six zero zero six one two three. Twenty-six year old male admitted under Pulmonology on March eighteenth.

Patient came with severe shortness of breath and wheezing since the previous night. Known case of bronchial asthma since childhood.

On arrival SpO2 was eighty-nine percent on room air. Respiratory rate was twenty-eight per minute.

Chest examination revealed bilateral wheeze.

Diagnosis: Acute exacerbation of bronchial asthma.

Patient was treated with nebulized bronchodilators, IV steroids, and oxygen therapy.

Symptoms improved within two days and oxygen saturation increased to ninety-seven percent on room air.

Discharge medications include inhaler Budesonide-Formoterol two puffs twice daily and tablet Montelukast ten mg at night.

Advise avoidance of dust exposure and allergens. Follow up in Pulmonology OPD after two weeks."

Variation 13: Nephrology (Acute Kidney Injury)

"Next patient is Sunil Verma, UHID two zero two six zero zero seven four four zero. Fifty year old male admitted under Nephrology on March twentieth.

Patient presented with reduced urine output and swelling of legs for three days. History of uncontrolled hypertension.

Blood tests showed elevated serum creatinine of three point two mg per deciliter.

Ultrasound kidneys showed mild bilateral renal parenchymal changes.

Diagnosis: Acute Kidney Injury likely secondary to dehydration and hypertension.

Patient was treated with IV fluids and blood pressure control medications.

Renal function improved gradually and urine output normalized.

Discharge medications include Amlodipine five mg once daily.

Advise adequate hydration and regular blood pressure monitoring. Follow up in Nephrology OPD after one week."
